

Angelus Introduces New Gold & Carbon Flying Tourbillon Watch

Looking for a sports watch with a **flying tourbillon**? [Angelus](#) Introduces a new Gold & Carbon Flying Tourbillon watch.

This limited edition of 18 pieces is housed within a sharp new 42.5 mm diameter case in carbon composite and red gold. The Angelus sports watch with a flying tourbillon features a A-250 caliber. Thus, it gives the luxury watch a three-dimensional skeletonized look. In addition, the array of bridges in relief, offer a graphic arrangement. As a result, it is much like the horological performance of this Angelus tourbillon.

Angelus was found in 1891 in Switzerland. The luxury watch brand is widely recognized by watchmaking connoisseurs as one of the most influential horological manufactures of the 20th century. The watch company's pioneering, house-made movements and vintage timepieces are desired by fine watch collectors around the world.

Stylish Case

Leading a new generation of Angelus cases is e Gold & Carbon Flying Tourbillon. It is sleek with dynamic lines. Therefore, befitting of the extreme technicality of this supremely graphic timepiece. The red gold crown has wide notches and protected by an asymmetrical guard projecting from the lugs.

Caliber

Meanwhile, the A-250 skeletonized flying tourbillon caliber is surrounded by an ultra-rigid and ultralight carbon composite container. It is held within an 18K 5N red gold case middle. Alos, it reveals another kind of skeletonization. The Gold & Carbon Flying Tourbillon comes with a black ballistic-style

rubber strap. It features an interchangeable system and red gold and titanium folding clasp.

Depth

The Gold & Carbon Flying Tourbillon has no dial. Although it does have a flange. Thus, it marks the transition between bezel and watch interior. It then graduates with sets of five increments. For example, each is separated by three-dimensional white gold hour-markers. These are filled with a luminescent substance. Because the flange is level with the bezel, it creates a sunken effect. As a result, it accentuates the feeling of depth in the A-250 calibre.

Contrast

The bridges of the Gold & Carbon Flying Tourbillon form its face. Without a dial, these components play an expressive role in any skeleton movement. The main plate of the A-250 calibre is black and made from woven carbon composite. So it nicely accentuates the contrasting 18K red gold bridges.

Stunning Display

The workings are housed within a vast sapphire crystal glass box. The transparent component is angled. It's almost vertically where it touches the bezel. Therefore, it provides a large, flat surface for the Gold & Carbon Flying Tourbillon watch's spectacular display.
